

In regards to Docket 03-104.

Hi-line or transmission on the power lines rf carrier current is not new. Power companies have used it for tele-communication since I don't know when.

Mostly it was poor quality sound and useless for telemetetrics. The new system power companies wish to use may or may not work but for sure of one thing, interference with other communications in the 30 Hz to 80mhz range will be unavoidable and will render many military, law enforcement and amateur radio frequencies useless from this interference.

I strongly urge the commission to deny the use of this form carrier transmission on power lines, for the sake and safety of our country.
